

Atlas Product Guide

Fictional company and policies. Created solely for this portfolio demo.

Create a workspace

Atlas is a fictional analytics product. To create a workspace, open Settings, choose Workspaces, then select Create workspace. Enter a name and invite team members. A workspace has one owner and up to ten editors.

Import data

Open Data Sources and select Upload CSV. Files must be UTF-8 encoded, no larger than 10 MB, and contain a header row. Atlas supports up to 50,000 rows per imported file.

Build a report

Open Reports and choose New report. Select a data source, choose dimensions and metrics, and select Run report. Save the report with a descriptive title.

Atlas Product Guide - continued

Export a report

Open a saved report, select Export in the upper-right corner, and choose CSV or PDF. CSV exports include the filtered rows. PDF exports include the visible charts and summary. Only owners and editors can export reports.

Access roles

Owners manage billing, workspace settings and invitations. Editors can import data, create reports and export results. Viewers can read reports but cannot edit, import or export.

Troubleshooting

If an import fails, check the file size, encoding and header row. If a report appears empty, clear date filters and verify that the source has data. This fictional guide does not describe prices or an API.
